CREATING HEALTHY SNACK FROM MILLET AND SPENT GRAINS USING EXTRUSION  
TECHNOLOGY

---

RESEARCH PROPOSAL

---

A proposal submitted in partial fulfillment of the  
requirements for the degree of Master of Science in the  
College of Agricultural and Biosystems Engineering  
at the University of Kentucky

By

Joseph Woomer

Lexington, Kentucky

Director: Dr. Akinbode Adedeji, Assistant Professor of Biosystems and Agricultural  
Engineering

Lexington, Kentucky

## Abstract

31 Food security is a major challenge for humanity, and the world's population growth  
32 continues to put pressure on global food production. Research is being done to make  
33 undervalued food sources more useful to industry and consumer alike. Spent grains  
34 (SG) from the brewing, brewers spent grain (BSG), and distilling industry, distillers spent  
35 grain (DSG), are rich in protein, dietary fiber, and essential amino acids, while offering a  
36 cheap source of the essential macro nutrients as well. Millets hardy nature and high  
37 nutrient qualities make them a suitable alternative crop for farmers when conditions are  
38 not favorable for more lucrative cereals, such as wheat, rice and corn. Millets are low in  
39 lysine, an essential amino acid found in SGs. This research intends to develop a puffed  
40 snack food from SGs and millet flour with the purpose of adding value to these grains.  
41 Feedstock particle size (250 and 1000 $\mu$ m), moisture contents (15-25%), type of SG (DSG  
42 vs BSG), and blend ratio (10 and 20% SG) are the parameters that will be studied to test  
43 their effect on extrudate's textural analysis, water solubility index (WSI), water  
44 absorption index (WAI), piece density, moisture, and radial expansion ratio (RER).

61

## Chapter One: Introduction

62 The world's demand for food is at an all-time high, and will continue to grow, as the  
63 world's population is expected to reach 9.7 billion by 2050 (UN, 2015). A research area  
64 gaining interest is recycling undervalued spent grains (SG) from the brewing and  
65 distilling process into quality foods due to their characteristically high amounts of  
66 protein and dietary fiber (Mussatto, Dragone, & Roberto, 2006). Millet grains also show  
67 promise in their ability to have an effect on the world's food security problems due to  
68 their hardy nature, low moisture requirements, and quality proximate composition  
69 (Gulati, Weier, Santra, Subbiah, & Rose, 2016). Extrusion processing is widely utilized in  
70 food industry because of its low energy requirements, short processing time, and ability  
71 to accomplish a number of unit operations including: mixing, conveying, and shaping,  
72 among others.

73

74 Kentucky is the world's leading producer of bourbon, with 1.15 million barrels (52.8  
75 gallons/barrel) produced in 2015, and a \$2 billion sales value (Kelly, 2017). Distillers  
76 spent grain (DSG), the main by-product of the distilling industry is usually given away at  
77 no cost to local farmers as a feed supplement, which has cost the Kentucky distilling  
78 industry an estimated \$5 million in potential revenue (Kelly, 2014). While bourbon has  
79 been a mainstay, Kentucky's craft beer scene has grown remarkably over the past 5  
80 years. Brewers spent grain (BSG) is the major by-product of the brewing industry and is  
81 also given away to local farmers for free. DSG and BSG are high in moisture (70% wb)  
82 which leads to a short shelf life of about four days, however once dried (10-12% wb) the  
83 shelf life becomes exponentially longer.

84

85 Millet, the 6<sup>th</sup> most produced cereal in the world, has yet to be embraced as ingredient  
86 in food processing in the US. It is mostly used as animal feed, but in other parts of the  
87 world, millet is a major staple used for making several different types of nutritious  
88 foods. Millet consideration as an alternative ingredient stems from its hardy nature,  
89 short growing season, and nutrient rich composition. Millet's nutritive composition is

90 comparable to wheat, while also enjoying a higher content of protein, fat, and crude  
91 fiber. Millet is superior to the wheat, rice, and corn in terms of its shorter growing  
92 season (60-100 days) and water use efficiency. Millet's drought resistance makes its  
93 important crop in some developing countries where water scarcity poses an agricultural  
94 challenge, and now in the developed countries as water availability issues continue to  
95 grow throughout the world.

96

97 Lynch et al. (2016) reported that essential amino acids constitute about 30% of SG  
98 protein content. Lysine, which is deficient in millet varieties, makes up 14% of the  
99 amino acids content in SG (Lynch, Steffen, & Arendt, 2016), which increases its  
100 attractiveness as a composite into millet-based snacks.

101

102 Extrusion is a technique used in the food industry to develop a variety of different  
103 products. It is applicable to the snack food industry due to its ability to create a puffed,  
104 ready to eat snack from different grains. Extrusion technology has been used in food  
105 processing since the 1900's for sausage production (Riaz, 2000). Today, the application  
106 of extrusion has grown to include snacks, pastas, cereals, candies etc. Extrusion  
107 processing is versatile operation combining many units of operation including mixing,  
108 shearing, cooking, puffing, and drying. Extrusion is a high temperature short time (HTST)  
109 process, making it an energy efficient process with a range of food applications.

110 Extrusion processing of grains results in a number of chemical and physical changes,  
111 namely: gelatinization of starch, denaturation of proteins, and inactivation of enzymes,  
112 microbial reductions, and reduction of anti-nutritional factors (Pathania, Singh, Sharma,  
113 Sharma, & Singla, 2013).

114

115 In conclusion, millet is a sustainable, nutritious, hardy alternative to major crops.  
116 Underutilized spent brewer's grain is another alternative food source for snack

117 development. Extrusion processing could be a tool used for creating functional snacks  
118 from these grains.

119

## Chapter 2: Objectives

120 Having millet developed into a desirable snack would add to its value; therefore, aiding farmers  
121 who rely on its economic impact. Millet is also a hardy, nutritious grain, ideal for areas where  
122 water is scarce and climate is often unforgiving, allowing it to be used as a situation crop  
123 when weather patterns are unfavorable for more common grains.

124 The objective of this research is to develop a nutritious extruded snack food from a  
125 combination of spent grains and millet, specifically:

- 126 1. Determine the effect of SG particle size on extruded snack quality characteristics.
- 127 2. Determine the effect of feedstock moisture content on extruded snack quality  
128 characteristics.
- 129 3. Determine if the type of spent grain has an effect on extruded snack quality  
130 characteristics.
- 131 4. Determine if the ratio of SG and millet has an effect on extruded snack quality  
132 characteristics.

133

### Chapter 3: Materials and Methods

#### 134 **Material Preparation**

135 Proso millet flour will be purchased from Bob's Red, and stored in a dry place until use. Water  
136 will be added to millet samples to alter moisture content to specified value. Brewers spent  
137 grain will be collected from Alltech's Inc. Lexington Brewery Division. Spent grains will be dried  
138 in an oven at 45°C. Spent grains will be milled to 250-1000µm particle size.

#### 139 **Extrusion**

140 A co-rotating twin screw 40:1 L/D laboratory scale extruder (EuroLab 1600, Thermo Scientific,  
141 Karlsruhe, Germany) will be used for producing the expanded snacks. A screw volumetric  
142 feeder will be used to deliver the feedstock at a rate to be determined based on preliminary  
143 trials. The extrusion barrel temperature will range between 50 – 130°C. Other extrusion  
144 conditions namely, screw speed and moisture inject rate will be determined based on the  
145 experimental design. The exit die has an internal diameter of 3 mm.

#### 146 **Product Analysis**

147 Proximate composition data will be measured, including: crude protein, crude fiber, ash and  
148 moisture. Physical characteristics of the product will also be measured, including: radial  
149 expansion ratio (RER), texture analysis, piece density, moisture, water absorption index (WAI),  
150 and water solubility index (WSI).

151 Radial Expansion Ratio Specific mechanical energy (SME) will be calculated using the following  
152 standard equation used by Kirjoranta et al. (2016):

$$SME \left( \frac{Wh}{kg} \right) = \frac{Screw\ speed(rps) \cdot Torque\ (Nm)}{Mass\ flow\ \left( \frac{kg}{h} \right)}$$

153 Moisture Content Moisture content for feedstock and extrudates will be determined using the  
154 hot air oven method (AOAC 1984).

155 Water solubility and Absorption Indices (WSI and WAI): WSI and WAI will be measured following  
156 the method by (Anderson, Conway, & Peplinski, 1970). The average of three replicates will be  
157 used for analysis.

158 Degree of gelatinization: Pasting properties: Extrudate will be ground to 250 microns, and the  
159 method of Singh and Adedeji (2017) will be followed.(Singh & Adedeji, 2017).

160 Texture Measurement: The textural characteristics (hardness and crispiness) of the extrudates  
161 will be determined using Texture analyzer TA.XT Plus (Texture Technologies Corporation) fitted  
162 with a Kramer shear cell, according to the method of (Meng, Threinen, Hansen, & Driedger,  
163 2010).

164 Microstructural Characterization (3D rendition, Porosity and Pore Size Distribution): An X-ray  
165 MicroCT scanner (SkyScan 1173 system, Bruker, Kontick, Belgium) will be used to obtain 3D  
166 images of the extrudate, determine the porosity, and pore size distribution according to the  
167 method of (Adedeji & Ngadi, 2011).

168 Experimental Design and Statistical Analysis: A full factorial design will be ran at 3 levels of SG  
169 (10 – 20%) to millet flour, 3 moisture contents (15 – 25%, wet basis (wb)), SG particle size (250  
170 vs 1000 mm), and two levels of spent grain source (BSG and DSG). Analysis of variance will be  
171 performed to determine the effect of model and where significant, mean separation will be  
172 done at 5% probability. All statistical analyses will be done using SAS (version 9.3).

1. Direct Costs

A. Salaries and Wages

(1) Based on current departmental stipend of \$16000/year for a first-year MS Research Assistant.

B. Fringe Benefits

- (1) Current University of Kentucky fringe benefit rate for graduate students is 8.85%
  - C. Travel
    - (1) Attendance at 2017 International Meeting of ASABE. Air fare estimated as \$500, three days' lodging and per diem at \$100 per day meeting registration of \$480.
  - D. Materials and Supplies
    - (1) 200 lbs of Millet at \$1/lb.
    - (2) Various food supplies, such as coating oils, cheese powders, etc.
  - E. Other Direct Costs
    - (1) Estimated 10-page article to be published in *Journal of Food Science* at \$120/page.
  - F. Modified Total Direct Costs. As per University of Kentucky guidance, calculated as Total Direct Cost less graduate tuition and equipment.
2. Indirect Costs. Calculated as 50.5% of Modified Total Direct Costs as per University of Kentucky Office of Sponsored Projects Administration.

Future Years: Salaries and wages are increased by 1.7%/year based on the 2015 Consumer Price Index.

## **Appendix: Research Plan**

### **MILESTONES**

4/20/2017: Finish training on micro CT, pycnometer, texture analyzer

6/16/2017: Comfortable creating variety of millet based snacks

8/20/2017: Completed snack recipes

10/1/2017: Paperwork in to IRB for review

10/29/2017: Proximate analysis completed

12/6/2017: Sensory Analysis Completed

12/26/2017: Statistical Analysis Completed

03/05/18: Send in Manuscript for approval
